TOPIC TAGS: polyaryl plastic, dicarboxylic acid, formaldehydo, thermoplastic material, polymor, plastic, phenol

ABSTRACT: This Author Certificate presents a method for obtaining heat-resisting polyarylates by treating linear saturated thermoplastic polyarylates (based on bis-phenols and dicarboxylic acids) with novolak or formaldehydo. To expand the assortment of heat-resisting materials, polyarylates based on phenolphthalein and dicarboxylic acids are used as linear saturated thermoplastic polyarylates.

TITLE: Heterochain polyesters. 62. Polyarylates from bisphenyldicarboxylic acids

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 2, 1966, 308-314

TOPIC TAGS: aromatic polyester, polyarylate, bisphenyl dicarboxylic acid, dihydric  
phenol, heat resistant polymer, polymer solubility, polymer film

ABSTRACT: The combination of high heat resistance and good mechanical properties  
with solubility in organic solvents was the purpose of this study of polyarylates  
(PA), synthesized from a dihydric phenol and a bicyclic dicarboxylic aromatic acid.  
4,4'-(I) or 2,2'-bisphenyldicarboxylic (II) or combinations of (I) and (II)  
acids were used as the bicyclic acid component, and bisphenol-A, phenolphthalein,  
phenolphthalein anilide, "phenoldiphenine" [2,2'-bis-(4-hydroxybenzoyl)bisphenyl]  
or xylenolphthalein were used as the phenolic component. Nonmixed and mixed PA were  
synthesized by equilibrium condensation in a nitrogen stream, in "Sovol" solution  
(Sovol-chlorinated bisphenyl). Only the acid components, i.e., (I), (II), or terephthalic  
acid, were used to prepare mixed PA. It was found that PA from (I) have a higher  
softening temperature as compared with analogous polyterephthalates and are still

UDC: 541.6+542.91

Card 1/2

L 21421-66

ACC NR: AP6009796

soluble in organic solvents (exception: PA from bisphenol-A). This solubility makes it possible to use these PA for manufacturing films, fibers, and lacquer coatings.<sup>13</sup> The dependence of the physical properties on the structure and composition of the PA obtained is discussed. Among other points it was noted that loose packing of polymer chains in phthaloyl or phthaloyl anilide derivatives is caused by the size of these side groups and the effect of the ortho-substitution in (II), which sharply decreases the softening temperature. Both nonmixed and mixed PA containing (I) can form mechanically strong films from solutions; such films retain their good mechanical properties at 290°C. Orig. art. has: 1 figure and 5 tables. [BN]

TOPIC TAGS: thermal degradation, thermal oxidation, organic compound, polymer/D 9 polyarylate

ABSTRACT: The thermal degradation and thermooxidation of polyarylate D-9 was investigated. This investigation is an extension of the previously published work of I. V. Zhuravleva, V. V. Rode, and S. R. Rafikov (Izv. AN SSSR, ser. khim., 1965, 269). The thermal degradation and thermooxidation were carried out over the temperature region from 325 to 500°C by 25°C intervals. Graphs for the kinetics of gas evolution during degradation and thermooxidation are presented. The composition of the thermooxidation-degradation products are tabulated. The

Card 1/3 2

experimental results obtained for the thermooxidation in air are shown graphically in Fig. 1 on the Enclosure. It is concluded that the thermooxidation degradation of polyarylate D-91 proceeds via a homolytic chain rupture accompanied by the evolution of CO<sub>2</sub>, CO, and H<sub>2</sub> gases. No induction period for the thermooxidation was observed. Orig. art. has: 2 tables and 6 graphs.

TITLE: Colored polyarylates of 4,4'-dihydroxyazobenzene.<sup>11415</sup> 80th report in the series  
On Heteropolyesters

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 12, 1965, 2052-2056

TOPIC TAGS: polymer, polyaryl plastic, polycondensation, thermomechanical property

ABSTRACT: Polyarylates of 4,4'-dihydroxyazobenzene (I) with phenolphthalein (II),  
dian (III), isophthalic (IV), and terephthalic (V) acids were synthesized and their  
physical properties were investigated. Study of the effects of the dibasic phenol  
upon the structure of the product and of the azo group upon its color was of partic-  
ular interest. Experimental work was performed using methods described by the  
authors in earlier publications (Vysokomolek. soyed., 6, 2174, 1964; 7, 322, 1965;  
7, 1543, 1965). It was found that polyarylates of I with IV and V do not melt but  
decompose above 400°C. Thermomechanical curves (see Fig. 1) indicate that while  
polymers derived from I reacted with IV and V possess low deformation and high rigid-  
ity, but that introduction of II and III increases the former and lowers the latter  
property. The solubility of homopolyarylates of I in organic solvents may be

TITLE: Synthesis of polyaryl esters of 2',7'-dihydroxyspiro[fluorene-9,9'-xanthene]

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 7, 1965, 1286-1288

TOPIC TAGS: polyaryl ester, heat resistant polymer, solubility

ABSTRACT: Homo- and co-polymeric polyaryl esters based on 2',7'-dihydroxyspiro[fluorene-9,9'-xanthene] have been prepared in an attempt to produce polyaryl esters having both heat resistance and good solubility in common organic solvents, and hence, better processability. The other reactants were terephthalic and/or isophthalic chloride and various bisphenols of the type

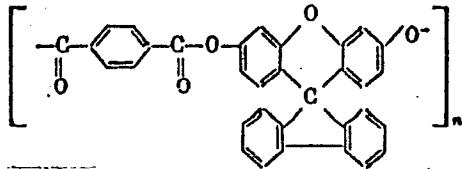

Card 1/2

L 01046-66

ACCESSION NR: AP5019781

(where R<sub>1</sub> and R<sub>2</sub> are aliphatic, perfluorinated, and aromatic substituents) as well as hydroquinone and resorcinol. The polymers and copolymers had high softening points (320–370°C) and good solubility in tricresol, tetrahydrofuran, and chlorinated hydrocarbons. The presence in the polymer repeat unit

of stable aromatic systems increases their thermal stability and suggests that they will also exhibit high radiation resistance. Orig. art. has: 1 table and 3 formulas.

TITLE: Heat-resistant electroinsulating polyarylate plastic material

B

SOURCE: Plasticheskiye massy, no. 9, 1965, 16-19

TOPIC TAGS: plasticizer, heat resistant plastic, heat resistant material, polyaryl plastic, terephthalic acid, electric insulator, plastic, heat resistance, polyarylate, phenolphthalein, bisphenol A, isophthalic acid, softening point

ABSTRACT: The possibility of preparing heat-resistant plastics suitable for electric insulators and capable of being compression molded was studied by preparing neat and mixed compositions from phenolphthalein isophthalate or terephthalate based polyarylates (i.e., aromatic polyesters). It was also attempted to prepare polymers which had to be kept at their melting temperature during compression molding for a minimum time. Thus, powdered poly(phenolphthalein isophthalate) could be compression molded at 270—300°C into semitransparent light-brown samples of plastic designated as F-1, while the poly(phenolphthalein terephthalate), designated as plastic F-2, cracked

Card 1/2

L 2324-66

ACCESSION NR: AP5022222

and disintegrated after being taken out of the molds. The addition of plasticizers, "Sovol" [biphenol dichloride], a polysiloxane and some other polyarylates based on either bisphenol A or phenolphthalein sebacate, made it possible to prepare compression molded samples from F-2 with softening points from 255 to 340C. The addition of Sovol in varying amounts or the same polysiloxane to F-1 produced plastics with softening points between 250 and 285C. Even the sample with 10% Sovol still had a softening point of 230C, which was considered to be sufficiently high, combined with good workability of the material. The introduction of fillers (up to 40% by weight of the composition) was also studied for the purpose of reducing cracking of the plastic and to save polymer materials. Good results were obtained with quartz flour or talcum, while aluminum oxide or silica gel were ineffective. The filled F-2 polyarylate samples were resistant to thermal shock; they withstood repeated sharp temperature change from -60 to 250C. The polyarylate compositions obtained had high dielectric properties in a rather wide range of temperatures. Orig. art. has: 4 figures and 4 tables.

AUTHOR: Vinogradova, S. V.; Andreyeva, M. A.; Davydova, V. F.; Korshak, V. V.

TITLE: Study of the feasibility of curing<sup>15</sup> and converting thermosetting polyaryl esters into end products

SOURCE: Plasticheskiye massy, no. 10, 1965, 1-3

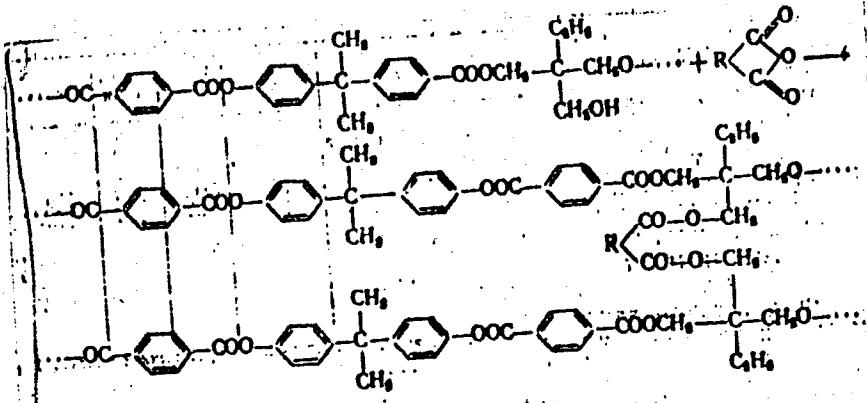

TOPIC TAGS: polyaryl ester, heat resistant plastic, polyaryl plastic

ABSTRACT: A study has shown that unfilled or quartz-filled cross-linked D-5 polyaryl ester can be processed into end products by molding. D-5, prepared from terephthaloyl chloride, bisphenol A, and 1,1,1-trimethylolpropane (1/0.5/0.5 molar ratio), is partly cross-linked (38% insoluble in chloroform) at the outset. Study of further cross-linking by various curing agents revealed that maleic and endic (cis-3,6-endomethylene-1,2,3,6-tetrahydrophthalic) anhydrides or tetrabutoxytitanium give the best results. Cross-linking occurs as follows:

Card 1/4

L 1868-66

ACCESSION NR: AP5024495

Study of D-5 molding showed the expediency of using a cross-linked polymer softening at 200–210°C and 60–70% insoluble. Such a polymer is rapidly molded (at 110–160°C) into solid products. Fig. 1 of the Enclosure shows the thermomechanical properties of D-5 and, for comparison, of D-2 polyaryl ester (from terephthalic acid and bis-phenol A). As Fig. 1 indicates, cross-linking considerably improves heat resistance.

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 16, 1965, 82

TOPIC TAGS: polyaryl ester, heat resistant polymer, cross linking

ABSTRACT: An Author Certificate has been issued for a preparative method for copolymers of unsaturated allyl-substituted polyaryl esters. The method involves copolymerization of the appropriate polyaryl esters with cross-linking agents at elevated temperature in the presence of free radical initiators. To improve the heat and chemical resistance of the copolymers, the cross-linking agents used are tetrafunctional acrylic monomers, e.g., allyl methacrylate, 2-allylphenol methacrylate, or 4, 4'-isopropylidenediphenol methacrylate. The copolymers so prepared are suitable as binders in glass-reinforced plastics. [SM]

TITLE: Colored polyaryl esters based on certain dihydroxyanthraquinones

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 9, 1965, 1543-1548

TOPIC TAGS: polyaryl ester, polymerization color, heat resistant polymer

ABSTRACT: To eliminate the dyeing step and to improve colorfastness, intrinsically colored polyaryl esters have been synthesized from dihydroxyanthraquinones, viz., alizarin, quinizarin, and quinizarin blue. Such starting materials were also of interest from the standpoint of the effect of repeat-unit structure on polymer properties, and because such polymers could be modified by treatment with metal salts. Homo- and co-polymeric polyaryl esters were prepared from the dihydroxyanthraquinones and terephthalic and isophthalic acids, and phenolphthalein by polycondensation in high boiling solvents. It was found that homo- and co-polymeric polyaryl esters from quinizarin and terephthalic or isophthalic acids, and from alizarin blue and terephthalic acid have high softening points, e.g., 475-500°C for the polymer from quinizarin and terephthalic acid. Copolymeric

polyaryl esters from the dihydroxyanthraquinones and phenolphthalein had good solubility in organic solvents and could be readily cast from solution to form films.<sup>4</sup> Such films were colored, strong (800—1200 kg/cm<sup>2</sup>) and elastic (10—15%). Film color could be modified by adding the appropriate metal salt to the polymer solution. Orig. art. has: 3 formulas, 3 figures, and 2 tables. [SM]

TITLE: Synthesis and investigation of polyarylates from 4,4'-biphenyldicarboxylic acid and diphenols with various substituents at the central carbon atom

15 44,55

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 10, 1965, 1689-1692

TOPIC TAGS: polyester, plastic, polyarylate

ABSTRACT: In the course of continuing investigations of polyesters, a series of polyarylates were prepared from bis-(4-hydroxyphenyl)methane, 2,2-bis-(4-hydroxyphenyl)propane, 2,2-bis-(4-hydroxyphenyl)hexafluoropropane, bis-(4-hydroxyphenyl)-phenylmethane, bis-(4-hydroxyphenyl)methylphenylmethane, bis-(4-hydroxyphenyl)trifluoromethylphenylmethane, bis-(4-hydroxyphenyl)diphenylmethane, 9,9-bis-(4-hydroxyphenyl)fluorene, and 4,4'-biphenyldicarboxylic acid. It was found that the physical properties of the polyarylates obtained depend to a large extent on the nature of the substituent at the central carbon atom. The physical constants and the mechanical characteristics of the polyarylates are given in tabular form. Orig. art. has: 2 tables.

TITLE: Investigation of the thermal stability of a series of polyarylates by differential thermal analysis

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 10, 1965, 1813-1817

TOPIC TAGS: polyarylate, plastic, polymer, thermal stability

ABSTRACT: Polyarylates were prepared from diphenols and terephthalic acid and subjected to differential thermal analysis utilizing thermogravimetric methods. It was found that the nature of the substituent at the central carbon of the diphenol (of the di-p-hydroxyphenylmethane type) exerts an appreciable influence on the thermal stability of the polyarylate. Thus, e.g., replacement of methyl groups at the central carbon atom by trifluoromethyl groups improves the stability of the polyarylate. The temperatures of incipient decomposition of the polyarylates investigated ranged from 375 to 465°C. The most thermally stable polyarylate was obtained from 9,9-bis-(4-hydroxyphenyl)fluorene and terephthalic acid. Orig. art. has: 2 tables and 5 figures. [VS]

SOURCE: AN SSSR. Doklady, v. 164, no. 3, 1965, 563-566

TOPIC TAGS: polycondensation, terephthalic acid, bisphenol, organic compound, polymer

ABSTRACT: The kinetics of the polycondensation of bis-(4-oxyphenyl)-methane, 2,2-bis-(4-oxyphenyl) propane, 2,2-bis-(4-oxyphenyl)-hexafluoropropene, bis-(4-oxyphenyl)-phenylmethane, 2,2-bis-(4-oxyphenyl)-2-phenylethane, bis-(4-oxyphenyl) trifluoromethylphenylmethane, and bis-(4-oxyphenyl)-diphenylmethane with the acid chloride of terephthalic acid in the temperature region from 160-200°C was investigated. The purpose of the investigation was the determination of the influence of the nature of substituents at the central carbon atom of bisphenols on the reactivity of the latter. The reactions were carried out in ditolyl methane in a

ABSTRACT: This Author Certificate presents a method for obtaining polyarylates by the condensation of chloroanhydrides of dicarboxylic acids with two-atom phenols in solutions of a high boiling point solvent. To increase the molecular weight of the obtained polymer, to lower the amount of solvent used, and to simplify the technique of separating the polymer, diphenyl chloride is used as the high boiling point solvent.

TITLE: Synthesis of poly(3,3'-azobenzenedicarboxylic acid)

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 2, 1965, 322-327

TOPIC WORDS: 11-carboxylic acids, azo compounds, carbon, chemical reaction.

ABSTRACT: The synthesis of 3,3'-azobenzenedicarboxylic acid polyarylates was accomplished by the equilibrium method and also by interphase polymerization. The polymerization was carried out in the presence of m-aminobenzoic acid, hydroquinone, and resorcinol. The 3,3'-azobenzenedicarboxylic acid was obtained with a yield of 80-90% by diazotization of m-aminobenzoic acid with subsequent decomposition of the diazo compound. The 3,3'-azobenzenedicarboxylic acid was converted into the corresponding polyarylates.

(melting point = 83.5-84.5°C). This product, colored yellow, was used as initial material for producing synthetic polyarylates. Both homogeneous and mixed polyarylates were formed. With phenolphthalein, both were found to be readily soluble in chloroform, acetone, and benzene, but insoluble in ether, hexane, and carbon tetrachloride. Polyarylates formed from the above polyesters and phenolphthalein had a melting point of 140°C. The polyarylates formed from the above polyesters and 2,6-naphthalenediimide had a melting point of 145°C.

TITLE: Studies in coordination polymers. 19. Exchange reactions in the poly-coordination process

SOURCE: Vyssokomolek. soyedin., v. 6, no. 4, 1964, 729-733

TOPIC TAGS: coordination polymer, polycoordination process, acetoacetyl diphenyloxide, beryllium acetylacetone, polycoordination exchange reaction, Huggins equation, Huggins constant, high molecular fraction, low molecular fraction

ABSTRACT: In order to study the exchange reactions it was necessary to produce polymer fractions differing considerably in molecular weight. This was achieved by fractionating a polymer synthesized from 4,4'-bis-(acetoacetyl)diphenyloxide and beryllium acetylacetone in solution, at 160°C, in vacuum, as described in an earlier paper by the authors (Vyssokomolek. soyed., 5, 1771, 1964). The fractionation of the polymer was conducted by methanol precipitation from a 1% dimethylformamide solution. Fourteen fractions were isolated, and the specific viscosities of these and of the nonfractionated polymers were determined in 0.5% dimethylform-

Card 1/2

ACCESSION NR: AP4032574

amide solutions. Values of 0.30-0.80 were obtained. They matched closely the 0.31-0.80 range for specific viscosities calculated by the Huggins equation. The study of the exchange reactions taking place during the polycondensation process was conducted on a mixture of high-molecular fraction of the polymer with a low-molecular fraction. The latter polymer was obtained under conditions of excess beryllium acetylacetone and contained no terminal free enolic groups. The experiment was conducted in a 25% dimethylformamide solution. The viscosity of the mixture of the two fractions was determined after heating the mixture to 100°C for periods up to 10 hours. It was found that the molecules of the polymer interacted at a rate of approximately the same order of magnitude as the rate of their growth from the issuing materials. It is concluded that the reaction of polycoordination of 4,4'-bis-(acetoacetyl)diphenyloxide and beryllium acetylacetone is a process of balanced polycondensation. Orig. art. has: 3 charts, 1 table, and 1 formula.
